Generation and initial analysis of more than 15,000 full-length
human and mouse cDNA sequences
Paragas, P. (26), 16899-16903 (2002)
                                                                                                                                                                                                                                                    Clone distribution: MGC clone distribution information can be found through the I.M.A.G.B. Consortium/LLNL at: http://image.llnl.gov Series: IRAK Plate: 123 Row: d Column: 22
This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA gi: 21312463.

Clone distribution: MGC clone distribution information can be for through the I.M.A.G.E. Consortium/LIMI at: http://image.llnl.gov Series: IRAK Plate: 182 Row: f Column: 6
This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency ORF analysis, Similarity but not identity to protein.

Location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cDNA Library Preparation: Express Genomics CDNA Library Arrayed by: The I.M.A.G.E. Description

cn co

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUMMARIES

29-JAN-2002; 2002WO-US001222.

```
CC Alzheimer's disease); autoimmune disease (e.g. systemic lupus

CC erythematosus, rheumatoid arthritis, insulin-dependent diabetes mellitus)

CC erythematosus, rheumatoid arthritis, insulin-dependent diabetes mellitus)

CC enders, burns; bone disorders (e.g. anaemia and thrombocytopaemia)

CC osteoarthritis); mechanical and traumatic disorders (e.g. stroke, head

CC trauma); lung or liver fibrosis; reperfusion injury in various tissues;

CC bacterial, viral or fungal infections; allergic conditions such as

CC allergic rhinitis, asthma; coagulation disorders (e.g. haemophilia);

CC cancer and tumours; and inflammatory diseases (e.g. septic shock, Crohn's

CC disease, anaphylaxis). The protein may be used to inhibit the growth,

CC viruses, or to effect bodily characteristics, biorhythms or circadian

CC cycles of rhythms. The protein may also have

CC proliferation, differentiation, stem cell growth factor, haematopoiesis

CC regulation, immune stimulating or suppressing, chemotactic/chemokinetic,

CC haemostatic and thrombolytic, receptor/ligand, and antinflammatory

CC activities. The cDNA sequences of the invention are useful for expressing

CC recombinant protein for analysis. The present sequence represents a novel

CC human cDNA sequence of the invention, this sequence is an expressed

CC sequence tag (EST) and was identified using subtractive hybridisation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to the cDNA sequences encoding an isolated novel human polypeptide. The protein encoded by the nucleic acid of the invention is useful for treating central and peripheral nervous system diseases (e.g. peripheral neuropathy, Huntington's disease, amyotrophic lateral sclerosis); neurodegenerative diseases (e.g. parkinson's disease, hatchard sclerosis).

cc metalloprotease (MP-1). (I) is useful for preventing, treating, or can ameliorating a medical condition, particularly an immune disorder, an cc aberrant glutamate transport or motor neuron disorder, such as cc amyotrophic lateral sclerosis (ALS), its juvenile form or an ALS-like condition. The compositions and methods are also useful for diagnosing, c prognosticating, treating, ameliorating and/or treating disorders (e.g. kleinfelter's syndrome, genital warts, or germinal cell clasorders (e.g. kleinfelter's syndrome, genital warts, or germinal cell caplasia), metabolic disorders (e.g. premature puberty, Kallman syndrome, or Cushing's syndrome), neurodegenerative diseases (Alzheimer's disease, Cc parkinson's disease, Huntington's disease or Tourette syndrome), liver c and renal disease and immune disorders (e.g. pneumonia, emphysema or cystic cor sepsis), pulmonary diseases (e.g. pneumonia, emphysema or cystic cor sepsis) and vascular, inflammatory and neurological disorders (e.g. Alzheimer's disease or Parkinson's disease). This sequence represents a metalloprotease MP1 polynucleotide

protein in screening its agonist, excitomotor and inhibitor and preparing an antibody against the CCCPLF protein; and (5) the use of the USGPLP polymcleotide sequences, proteins, agonists, excitomotors, inhibitors and antibodies in treating diseases related to the abnormal OSGPLP gene and in preparing the medicine composite for the treatment

The present sequence encodes human O-sialoglycoproteinase-like protein (OSGPLP). The present invention also describes: (1) the preparation of the OSGPLP protein; (2) applying the OSGPLP protein in diagnosis; (3) the prevention and/or treatment of related diseases; (4) utilising the OSGPLP

metalloproteinase activity, neurological disorders. New isolated nucleic acid encoding MP-1 protein, useful for preventing treating, or ameliorating diseases associated with aberrant metalloproteinase activity, e.g. immune, metabolic, inflammatory and P-PSDB; ABG96478.

2002-723329/78.

Claim 1; Fig 1A-C; 473pp; English.

metalloprotease (MP-1). (I) is useful for preventing, treating, or ameliorating a medical condition, particularly an immune disorder, an aberrant glutamate transport or motor neuron disorder, such as amyotrophic lateral sclerosis (ALS), its juvenile form or an ALS-like condition. The compositions and methods are also useful for diagnosing, prognosticating, treating, ameliorating and/or treating disorders associated with MP-1 activity, e.g. diabetes, cancer, reproductive disorders (e.g. Kleinfelter's syndrome, genital warts, or germinal cell aplasia), metabolic disorders (e.g. premature puberty, Kallman syndrome, or Cushing's syndrome), neurodegenerative diseases (Alzheimer's disease, Parkinson's disease, Huntington's disease or Tourette syndrome), liver and renal diseases and immune disorders (e.g. AIDS, rheumatoid arthritis The invention describes an isolated nucleic acid molecule (I) encoding metalloprotease (MP-1). (I) is useful for preventing, treating, or or sepsis), pulmonary diseases (e.g. pneumonia, emphysema or cystic fibrosis) and vascular, inflammatory and neurological disorders (e.g. Alzheimer's disease or Parkinson's disease). This sequence represents metalloprotease MP1 polynucleotide

The invention relates to an isolated polypeptide comprising: any of 28 cc sequences of 48-1256 amino acids; a natural amino acid sequence at least composition of 28 telentical to the 28 amino acids sequence, 94% identical to a sequence of 173 or 267 amino acids, 96% identical to a sequence of 414 amino composition of 28 acids, or 97% identical to a sequence of 414 amino composition of 267 amino acids, 96% identical to a sequence of 414 amino composition of 27% identical to a sequence of 414 amino composition of 27% identical to a sequence of 414 amino composition of 28% identical to a sequence of 414 amino composition of 28% identical to a sequence of 414 amino composition of 28% identical and polymoclectides are useful composition of 28% identical and polymoclectides are useful composition of protein modification and maintenance compositions associated compositions of protein modification and maintenance compositions (e.g. bacterial flammatory diseases (e.g. cancer, compositions), neurological disorders (e.g. stroke, Parkinson's disease, compositions (e.g. bacterial, viral, parasitic, proteozoal). These are also compositions (e.g. bacterial, viral, parasitic, proteozoal). These are also composited in assessing the effects of exogenous compounds on the expression composition of nucleic acid and amino acid sequences of pMOD. The pMOD or its composition of the polypeptides, or in altering the expression of the carget polymucleotide and compounds that specifically bind to or modulate the activity of the polypeptides. The microarray is useful in monitoring compositions, and compositions, and compositions, and composition of the invention of the inv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      22-JUN-2001; 2001US-0300508P.

```
The present invention relates to novel 38650, 28472, 5495, 65507, 81588
CC or 14354 nucleic acid molecules which encode adenosine deaminase, glyco-
CC protease or seven transmembrane domain (77M) receptor family members.
CC Sequences of the invention are useful in diagnosing and treating cancer
CC or aberrant cellular proliferation and/or differentiation (e.g. colon or
CC lung cancer), immune disorders (e.g. selective IgA deficiency, rheumatoid
CC arthritis, diabetes, allergy), heart or cardiovascular disorders (e.g.,
CC hypertension, atherosclerosis, arrhythmias, ischaemic heart disease,
CC myocardial infarction, thrombus) including endothelial cell disorders
CC (e.g. psoriasis, Grave's disease), haematopoietic disorders, brain
CC disorders (e.g. cerebral oedema, Parkinson's or Alzheimer's disease),
CC pain and metabolic disorders (e.g. obesity), liver disorders or platelet
CC disorders. They are also useful in screening assays, predictive medicine
CC (e.g. diagnostic assays, prognostic assays, monitoring clinical trials
CC and pharmacogenetics) and prophylactic and therapeutic methods. The
CC consoic biology and as surrogate markers. Sequences of the invention are
                                                                                                                                                                                                                                                                                                                                                                                                                                    New 38650, 28472, 5495, 65507, 81588 or 14354 nucleic acid molecules, useful for diagnosing and treating cancer, immune, cardiovascular, hematopoietic, brain, pain, metabolic, liver or platelet disorders, a
                                                                                                                                                                                                                                                                                                                                                                                    Claim 1; Fig 8; 178pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  08-NOV-2000; 2000US-0246768P.
